

RootX

Maximize Your Benefits and Results:

1. Install **RootX** only after the Spring Thaw, and before the Winter Freeze Up. Over the winter, trees become dormant, and your **RootX** installation will not be as successful.
2. Use the Push Rod End at every **RootX** install. You must ensure a full pipe of foam the entire length of the lateral to get maximum results.
3. Never install a 4 pound jar of **RootX** in one lift. Always split the jar into 2 – 2lb lifts, using 5 gallons of water after each 2 pound lift.
4. **RootX** is a maintenance item. It is not a cure-all. If you normally cut a line once every year, make sure to go back and do another **RootX** application on the anniversary date of the original install.
5. Camera your lines that have been treated with **RootX** every year to 18 months, applying **RootX** as shown to be required by your video tapes.
6. Use the **“RootX Has Been Applied”** stickers that are provided to you and place them on all water fixtures and appliances. It is critical to a successful **RootX** application that water is not used for at least 6 hours. You must give the **RootX** time to bond with the lateral to help impede future root growth.
7. Follow the installation techniques and instructions shown on Wallace’s tutorial tape. Using the correct steps and equipment will help to ensure a great **RootX** treatment and result.
